

From The Trunk

SEO Inventory Audit

Complete read-only inventory of source definitions and server-rendered HTML from a fresh local production build. Generated 2026-07-22T15:21:16.378Z.

Not production SEO-ready: 0 Critical and 9 High issue rows require resolution or explicit acceptance.

URLs crawled 124	Files scanned 650	Product pages 56	SEO phrases 21,195
Internal links 6,315	Outbound links 716	Critical issues 0	High issues 9

Backlink status: no Search Console, Ahrefs, Semrush, or other backlink export was present. Outbound links were inventoried separately and were not treated as backlinks.

Scope and methodology

- Static scan: app, components, lib, data/content when present, public assets, configuration, redirects, navigation, schema/metadata helpers, and tests.
- Rendered scan: fresh production build served at 127.0.0.1:3100 and crawled with HTTP GET only.
- Discovery: sitemap.xml, App Router page files, build prerender manifest, nav/footer/body links, llms.txt, redirects, PDF routes, utility probes, product links, and database-backed runtime inventory.
- Safety: no external page was fetched; outbound URLs were recorded only. The social-feed integration was disabled for the audit build.
- Precedence: rendered production HTML wins when static source and runtime output disagree.

Key verified counts

Public indexable pages	79	Noindex pages	31
Unexpected indexable private/utility	1	Redirects	13
404 responses	7	5xx responses	1
Pages in sitemap	75	Missing from sitemap	4
Duplicate titles	0	Duplicate descriptions	0
Missing H1	0	Multiple H1	0
Canonical mismatches	0	Invalid-schema pages	0
Pages with missing alt	0	Soft-404 risks	0

Top priority findings

No Critical issue was verified. The list below contains the nine High findings plus the next highest-priority Medium finding.

1. **High** - Canonical indexable page is missing from the sitemap.

Scope: /collection/fabric/chiffon

Evidence: Status 200; robots index, follow; canonical <https://www.fromthetrunk.shop/collection/fabric/chiffon>

Action: Add the route only after confirming durable content and canonical indexability.

2. **High** - Canonical indexable page is missing from the sitemap.

Scope: /collection/fabric/georgette

Evidence: Status 200; robots index, follow; canonical <https://www.fromthetrunk.shop/collection/fabric/georgette>

Action: Add the route only after confirming durable content and canonical indexability.

3. **High** - Utility/private/query page is indexable.

Scope: /admin

Evidence: Robots meta index, follow; X-Robots-Tag none

Action: Emit the intended noindex directive at page or response-header level.

4. **High** - Canonical indexable page is missing from the sitemap.

Scope: /collection/rose-vine-stripe-chiffon-saree

Evidence: Status 200; robots index, follow; canonical <https://www.fromthetrunk.shop/collection/rose-vine-stripe-chiffon-saree>

Action: Add the route only after confirming durable content and canonical indexability.

5. **High** - Canonical indexable page is missing from the sitemap.

Scope: /collection/coral-sunrise-chiffon-georgette-saree

Evidence: Status 200; robots index, follow; canonical <https://www.fromthetrunk.shop/collection/coral-sunrise-chiffon-georgette-saree>

Action: Add the route only after confirming durable content and canonical indexability.

6. **High** - robots.txt disallows customer utility pages whose metadata intends noindex, follow.

Scope: /account, /cart, /checkout, /search

Evidence: The disallow rules can prevent crawlers from fetching the pages and observing noindex, follow.

Action: Allow these utility pages to be crawled while retaining noindex, follow metadata; keep admin/API protections separate.

7. **High** - Primary internal links point to noindex collection query variants instead of dedicated canonical landing pages.

Scope: Header and homepage category links

Evidence: Top Viewed and Blouses use collection query URLs; homepage fabric cards also use filters while canonical landing routes exist.

Action: Link the relevant labels to /top-viewed, /blouses, and eligible canonical fabric/occasion landing pages.

8. **High** - Some keyword pages can become indexable at the product threshold but remain permanently excluded from the sitemap.

Scope: /collection/fabric/* and /collection/occasion/*

Evidence: Metadata indexability is count-driven, while sitemap:false is checked before product counts.

Action: Make sitemap inclusion use the same product-count eligibility decision as metadata, with explicit route policy overrides only where intentional.

9. **High** - Indexable legal pages contain unresolved bracketed business placeholders.

Scope: /policies/*

Evidence: The source flags placeholders and includes provisional grievance officer/contact/address values.

Action: Replace every placeholder with approved legal entity, jurisdiction, officer, contact, hours, and address details before launch.

10. **Medium** - Static, policy, and keyword sitemap lastmod values use one synthetic 2026-04-27 date.

Scope: /policies/* and static pages

Evidence: Rendered policies display later effective dates, including June 29, 2026.

Action: Derive lastmod from maintained content timestamps or a route-specific audited constant.

Quick wins

1. Add the route only after confirming durable content and canonical indexability.
2. Emit the intended noindex directive at page or response-header level.
3. Allow these utility pages to be crawled while retaining noindex, follow metadata; keep admin/API protections separate.
4. Link the relevant labels to /top-viewed, /blouses, and eligible canonical fabric/occasion landing pages.
5. Make sitemap inclusion use the same product-count eligibility decision as metadata, with explicit route policy overrides only where intentional.
6. Derive lastmod from maintained content timestamps or a route-specific audited constant.
7. Verify preview response headers live and make draft-mode noindex, nofollow explicit if not already enforced upstream.
8. Apply a data threshold or render durable editorial content sufficient for an indexable landing page.
9. Review for a unique, factual description around 120-155 characters; do not keyword-stuff.
10. Review for clarity around 30-60 characters without truncating required product identity.

PDF source-of-truth compliance

Complete	13
Intentionally mapped	5
Partial	4
Missing	0

- **Collection** (/collection): Partial; mismatch in H1.
- **Product template** (/collection/magenta-mist-chiffon-drape): Partial; mismatch in H1, title, meta.
- **Product filled example** (/collection/magenta-mist-chiffon-drape): Partial; mismatch in meta.
- **How It Works** (/how-it-works): Partial; mismatch in H1.

Business decisions before production

- /policies/*: Replace every placeholder with approved legal entity, jurisdiction, officer, contact, hours, and address details before launch.
- Sold product PDPs: Choose and document a sold-product retention policy, then reuse one eligibility function across metadata, sitemap, and llms.txt.
- /top-viewed: Apply a data threshold or render durable editorial content sufficient for an indexable landing page.
- Sitewide Organization schema: After ownership verification, align Organization sameAs with approved official profiles.
- /our-team: Choose the intended scope (team or founders) and align route copy and metadata after editorial approval.

Validation and limitations

- pnpm test passed: 151 files and 1,798 tests.
- pnpm lint passed.
- pnpm exec tsc --noEmit passed.
- Fresh production build passed with BEHOLD_FEED_URL disabled for local-only crawling; 54 App Router paths were reported.
- Runtime Node v25.4.0 is outside the repository's declared <25 range; CI pins Node 22. Re-run release gates under Node 22.
- Authenticated admin Lighthouse could not run because FTT_LHCI_AUTH_EMAIL and FTT_LHCI_AUTH_PASSWORD were unavailable.
- No current SEO ZIP, workbook, backlink export, or keyword export was present. A deleted historical ZIP was inspected read-only from Git history.
- The /admin probe returned HTTP 200 with index, follow through the site catch-all, while the only concrete admin page remains session/role protected and noindex, nofollow.
- The .well-known Chrome DevTools metadata handler returned one non-SEO HTTP 500; it remains captured in the route inventory.

Delivered artifacts

- seo-inventory-raw.json - complete machine-readable source, crawl, schema, link, image, keyword, and issue evidence
 - SEO_INVENTORY_SUMMARY.md - review summary
 - csv/ - 24 UTF-8 sheet-equivalent CSVs
 - CSV_MANIFEST.md - requested-sheet to CSV mapping and Excel-safe labels
 - sitemap-rendered.xml, robots-rendered.txt, llms-rendered.txt, and crawl-manifest.json - supporting runtime evidence
- A single XLSX was not generated because the required @oai/artifact-tool runtime and workspace dependency loader were unavailable. The requested CSV fallback is complete.
